

CSS IDEAS

The website will have a **black** and **green** color scheme that reflects the style of terminals and hacking. The font used will also resemble that of a terminal, enhancing the overall theme.

The **homepage** will feature a minimalist design, with a central title that captures attention (maybe with movement). The background will be animated, with visual effects that mimic the movement of code in a terminal, creating a dynamic and engaging atmosphere.

The **navbar** will be designed as a vertical sidebar that can hide, adding an interactive element to the site's design. This sidebar will open with a dedicated button, allowing users to access it easily when needed. Once opened, the navbar will display a list of links to different sections of the site.

The other **pages** of the site will have a very clean and simple style, keeping the black and green color scheme. The goal is to ensure optimal readability and a smooth user experience, avoiding overly complex or chaotic elements. This will allow users to focus on the information without distractions, making the site navigation a pleasant and intuitive experience. For each command, there will be a page that will follow more or less the same layout (Usage, Options, Examples, Quizz...).
